Description, Industrial Flush Valve

Page 2 P/N 20-04805-00 Rev. C

The FM-500 series Flush Manifold is a universal design compatible with our LM and LL series liquid laundry dispensing systems.

INSTALLATION

The FM-500 series Flush Manifold is comprised of two major components, a Manifold Assembly and a choice of two different Flush Valve assemblies.

The Standard Flush Valve Assembly consists of a pipe tee/water inlet fitting (1/2" tube) at the top, an ASCO brass solenoid valve, a flow switch (for connection to LL-9000 dispensers or to our LM series Flush Interface Kit), and a 1/2" hose barb at the bottom for hose connection to the Manifold Assembly.

SYSTEM SETUP

The Industrial Flush Valve Assembly consists of a single water inlet (1/2" hose barb, no pipe tee), a water pressure gauge with an "open to read" water valve on top, a water pressure regulator, an ASCO brass solenoid valve, a flow switch (for connection to LL-9000 dispensers or to our LM series Flush Interface Kit), with a 1/ 2" hose barb at the bottom for hose connection to the Manifold Assembly.

SPARE PARTS LISTING

The Manifold Assembly is a horizontal pipe with check valves, a vacuum relief valve, and a pressure gauge with an "open to read" water valve, all mounted on the top. A 1/2" hose barb for hose connection to the Flush Valve Assembly, and a 5/8" tube compression fitting for polyflow discharge tubing connection on the ends.

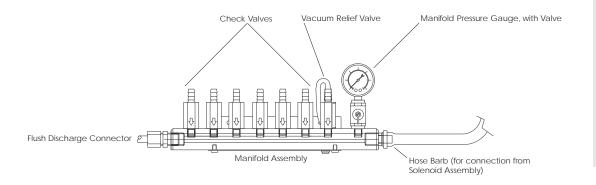

SPECIFICATIONS

The modular design allows more installation flexibility with liquid laundry chemical dispensing systems. Both the Manifold and Valve Assembly Brackets may be reversed to allow installation for flow from left to right. All three of the FM-500 series assemblies are backwards compatible with our earlier FM-400 series manifold system as spare or upgrade parts.

1.1 **Theory of Operation**

The FM-500 series Flush Manifold transfers liquid laundry chemical products from the dispensing system to the washer using water flow (or flush) via a single discharge tube. The dispenser pumps into the manifold via the check valves. The flush valve controls water flow through the manifold which in turn transfers product to the washer. The vacuum relief valve allows any standing water in the system to drain into the washer without drawing a siphon on the product pumps. A manifold pressure gauge is present to measure and set system pressure while flushing. The flush valve may be controlled either by our LL-9000 dispenser using our XLF or EXF Orion controllers, or by our LM-100 series dispenser using an Orion E series controller (this limits the LM-100 dispenser to five pumps) with our Flush Interface Kit (Nova Controls P/N 13-04830-00).

P/N 20-04805-00 Rev. C

2.0 INSTALLATION

DESCRIPTION

INSTALLATION

The laundry dispensing system should be installed prior to the Flush Manifold. A method of driving the flush valve needs to be determined on the initial site survey. We strongly recommend using the flush valve drive capabilities of our Orion E series or XLF controllers, with our safety interlocks in place for the most reliable, and safest, operation.

SYSTEM SETUP

CAUTION: A locally approved backflow prevention device—not provided—is required for safe and legal operation. A water pressure regulator is required for use with our standard Flush Valve Assembly. This regulator may be shared by a number of flush valves, limited by the water flow and pressure at the site.

2.1 Manifold Assembly Installation

SPARE PARTS LISTING

2.1.1 Position the Manifold Assembly on the wall below the dispenser Pump Module. Reverse the Manifold mounting bracket position when flow from left to right is desired.

NOTE: Allow clearance for the Pump Module cabinet to open.

- 2.1.2 Using a pencil, outline each of the two holes on the Manifold mounting bracket.
- 2.1.3 Drill the outlined holes with a 1/4" masonry bit and place a wall anchor, supplied, into each hole.
- 2.1.4 Secure the Manifold assembly to the wall anchors with supplied screws.

2.2 Pump Tube Connection

Use short lengths of 3/8" ID tubing and appropriate size (3/8" x 3/8" or 1/4" x 3/8") hose barbs, supplied in the installation kit, to connect the discharge side of the dispenser pumps to the Check Valve hose barbs.

- 2.2.1 Connect short lengths of the 3/8" ID flexible tubing to the dispenser pump tubes with the provided hose barbs. Secure with hose clamps or tie wraps to ensure a leak free assembly.
- 2.2.2 Trim the 3/8" ID tubes to fit—do not connect to the check valves yet.
- 2.2.3 Perform "Calibrate Pumps" on the Orion controller, capturing product at the ends of the tubing.
- 2.2.4 Connect tubes to the hose barbs on the check valves. Secure with hose clamps or tie wraps to ensure a leak free assembly.

2.3 Flush Valve Installation

- 2.1.1 Position the Flush Valve Assembly on the wall beside the dispenser Pump Module. Reverse the Flush Valve mounting bracket position when flow from left to right is desired.
- 2.1.2 Using a pencil, outline each of the two holes on the solenoid mounting bracket.
- 2.1.3 Drill the outlined holes with a 1/4" masonry bit and place a wall anchor, supplied, into each hole.
- 2.1.4 Secure the flush valve assembly to the wall anchors with supplied screws.

2.4 Water Supply Connection, Standard Flush Valve

Use 1/2" Polyflo tubing for water supply connection from the water pressure regulator and back flow prevention device—not provided. A plugged female 1/2" NPT pipe connection to connect plumbing fittings for multiple manifolds is available on the water supply pipe tee fitting.

WARNING: An approved Back Flow Prevention Device and Water Pressure Regulator (set for a reading of no more than 10 psi on the manifold pressure gauge while flushing)

MUST be used between the Flush Valve and water source.

- 2.4.1 Measure the distance from the water pressure regulator—not provided—to the Flush Manifold water supply connection.
- 2.4.2 Cut a piece 1/2" Polyflo tubing—not provided—to the desired length.
- 2.4.3 Connect the tubing to the output of the water pressure regulator.
- 2.4.4 Connect the opposite end of tubing to the water supply connection 1/2" compression fitting.
- 2.4.5 Affix provided plumbing caution label in area of Flush System.

SPECIFICATIONS

Page 4 P/N 20-04805-00 Rev. C

2.5 Water Supply Connection, Industrial Flush Valve

Use 1/2" ID hose for water supply connection from the back flow prevention device—not provided.

WARNING: An approved Back Flow Prevention Device MUST be used between the Flush Valve and water source.

- 2.5.1 Measure the distance from the water source to the Flush Valve water supply connection.
- 2.5.2 Cut a piece 1/2" ID hose—not provided—to the desired length.
- 2.5.3 Connect the tubing to the water source.
- 2.5.4 Connect the opposite end of tubing to the water supply connection 1/2" hose barb, and secure with a hose clamp.
- 2.5.5 Affix provided plumbing caution label in area of Flush System.

SYSTEM SETUP

2.6 Flush Discharge Connection

Use a single 5/8" Polyflo flush outlet tube—not provided—to deliver product to the laundry machine. It is important that the flush discharge tubing DOES NOT exceed 50'.

- Measure the distance from the Flush Manifold to the laundry machine. 2.6.1
- 2.6.2 Cut a piece 5/8" Polyflo tubing—not provided—to the desired length.
- 2.6.3 Connect the tubing to the Flush Manifold discharge 5/8" compression fitting.
- 2.6.4 Route the tubing to the laundry machine and secure at the product injection port.

NOTE: Secure the flush discharge tube at the laundry machine so that the water flush will rinse the product injection area. This will help ensure against chemical attack to the laundry machine. Secure all tubing for a neat and clean installation.

2.7 Flush Valve to Manifold Connection

- 2.7.1 Measure distance from Flush Valve to the Manifold and trim the provided 1/2" ID Hose to fit.
- 2.7.2 Connect the Hose to the hose barb at the bottom of the Solenoid Assembly and the hose barb on the right side of the Manifold.
- Secure both ends of the hose with provided ratchet clamps. 2.7.3

2.8 Hard Copper Plumbing

If the water supply connection must be copper tubing, you will be responsible for the correct pipe fittings and connectors to complete the installation. Always use an approved Back Flow Prevention Device and Water Pressure Regulator. Plastic compression fittings can be removed and replaced with the appropriate fittings to accommodate copper tubing. Use RTV sealant on the plastic plumbing threads and DO NOT solder to fittings that are threaded into plastic. Water supply lines require a minimum 1/2" tube.

2.9 **Electrical Connections**

The FM-500 series flush valve may be equipped with a choice of AC voltage solenoid coils for flush activation. Confirm that your coil voltage is correct for your application. LL-9000 dispensers take a 24 volt, AC, coil. With LM-100 series and LL-6000 series dispensers, the solenoid coil voltage needs to match the pump motor voltage.

WARNING: DO NOT connect any voltage other than what is called out on the solenoid coil. A wire conduit is required for solenoid coil wiring when using any coil voltage over 24 volts, AC. The bottom of the solenoid coil is threaded to accommodate conduit.

The solenoid valve has two wires, labeled "Solenoid Coil", with 1/4" female push on connectors for connection to the LL-9000 flush output wiring harness or to the Flush Interface Kit flush output wires. A green ground wire is also present which should be run to the dispenser cabinet.

The flow switch has two wires, labeled "Flow Switch", with 1/4" male push on connectors. These wires connect to the LL-9000 flush wiring harness blue wires (to pressure switch input on the circuit board) or to our Flush Interface Kit safety interlock blue wires. These wires are low voltage and may be run exposed in most areas.

- 2.7.1 Connect the solenoid coil power wires to the Solenoid coil wires from the LL-9000 pcb, or to the Flush Interface kit solenoid coil wires.
- Connect the Flow Switch wires to the Pressure Switch input of LL-9000 pcb, or Flush Interface kit 2.7.2 flow switch wires.

3.0 SYSTEM SETUP

DESCRIPTION

INSTALLATION

SYSTEM SETUP

SPARE PARTS LISTING

SPECIFICATIONS

Check entire dispensing system for correct electrical and plumbing connections. After pump calibration and formula programming, test run the system to determine appropriate flush time setting to transfer all product to the washer. Input new flush time in program mode of the controller. Also, re-confirm that the washer calls for product at appropriate times and the dispensing system pumps when it should. Flush system pressures should be measured at the manifold pressure gauge by opening the gauge protection valve while flushing. Adjust the water pressure regulator for no more than a 10 psi reading on the manifold gauge while flushing. Inspect flush system for water leaks, and test run a load of linen.

CAUTION: Turn off gauge valve when done reading manifold pressure to prevent water hammer damage to gauge.

To manualy open flush valve, to purge or clean water lines and manifold, press up or down arrow on the Orion E series controller to access a manual flush control.

9.3 Limited Warranty

This unit is warranted against defects in materials and workmanship for a period of one year from the date of delivery and covers all parts of the unit except for the elastomer pump tubing. Any units which prove to be defective within the warranty period will be repaired or replaced when returned to the factory freight prepaid. No other warranty is expressed or implied. Equipment abuse or misuse voids warranty. Warranty does not cover any consequential liability resulting from the performance of the equipment.
